

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application.

Listing of Claims:

1. (Currently amended) A system for incrementally executing a client/server application, leveraging existing communications network infrastructure having at least one client computer and at least one server computer, wherein the at least one client computer and the at least one server computer are in communication with each other over one or more communications links within the network infrastructure, the system comprising:

a client/server application comprising a server application component and a client component,

the server application component comprising a plurality of server component portions, and provided on the at least one server computer, the server component portions including an initial server component portion and one or more subsequent server component portions, the initial server component portion having an initial function, each of the one or more subsequent server component portions including at least one subsequent function;

the client application component provided on the at least one client computer, the client component including one or more command selectors, each of the one or more command selectors having:

associated code for selecting a function available from the plurality of ~~portions~~ the server ~~application~~ component portions; and

associated code for generating a ~~an~~ associated parameter for use by the server application component in determining the appropriate server component portion of the plurality of server component portions to load and execute on the server computer to provide the selected function to the client computer, the parameter being an initial parameter or a subsequent parameter;

the at least one server computer including:

a memory for executing the server application component;

means for receiving an initiating message from the client computer, the initiating message including the initial parameter associated with the initial server component portion;

means for loading into the memory, in dependence upon the initial parameter, the initial server component portion;

means for executing the initial server component portion loaded into the memory to provide the initial function to the client computer;

means for receiving a subsequent message from the client computer, the subsequent message including the subsequent parameter associated with a subsequent server component portion;

means for loading into the memory, in dependence upon the subsequent parameter, the subsequent server component portion; and

means for executing the subsequent server component portion loaded into the memory to provide the subsequent function to the client computer.

~~whereby the portions are incrementally loaded and executed on the server computer in response to the code and parameter from the one or more command selectors for the client/server application.~~

2. (Currently amended) The system according to claim 1, wherein one portion of the plurality of server component portions is a compact portion initially loaded and executed on the at least one server computer upon receipt of a first application function request from the client component, the compact portion delivering a subset of functions applicable to commands most commonly requested to provide a fast executing initial portion of the application.

3. (Currently amended) A method for incrementally executing a client/server application, leveraging existing communications network infrastructure having at least one client computer and at least one server computer, the at least one server computer comprising a server processor and a memory for executing a server component wherein the at least one client computer and the at least one server computer are in communication with each other over one or more communications links within the network infrastructure, the method comprising the steps of:

(i) providing a server application component comprising a plurality of server component portions on the at least one server computer, the server component portions including an initial server component portion and one or more subsequent server component portions;

(ii) providing a client component on the at least one client computer, the server application component and the client component forming a client/server application;

(iii) loading into the memory of the server computer, in dependence upon a parameter contained in a request from the client component for an application function, the initial server component portion;

~~[[(iii)]]~~ (iv) loading and executing, on the server computer, an appropriate portion from the plurality of portions of the server application component applicable to and upon an initial request from the client component for an application function the initial server component portion to provide an initial function to the client computer;

(v) loading into the memory of the server computer, in dependence upon a subsequent parameter contained in a subsequent request from the client component, the subsequent server component portion; and

~~[[(iv)]]~~ (vi) loading and executing, on the server computer, the subsequent server component portion to provide a subsequent function to the client computer. an applicable additional portion of the plurality of portions of the server application component for each request received from the client component for an application function not available from any running portion or portions of the server application component; and

~~[[(v)]]~~ running all executed portions until an end session command is received.

4. (Currently amended) The method according to claim 3, wherein one portion of the plurality of server component portions is a compact portion initially loaded and executed on the server computer upon receipt of a first application function request from the client component, the compact portion delivering a subset of functions applicable to commands most commonly requested to provide a fast executing initial portion of the application.

5. (Currently amended) A system for incrementally executing a client/server application, leveraging existing communications network infrastructure having at least one client computer and at least one server computer, wherein the at least one client computer and the at least one server computer are in communication with each other over one or more communications links within the network infrastructure, the system comprising:

a module for providing a server application component comprising a plurality of server component portions on the at least one server computer;

a module for providing a client component on the at least one client computer, the server application component and the client component forming a client/server application;

component portion from the plurality of server component portions of the server application component applicable to and upon an initial request from the client component for an application function, the initial request including a parameter associated with the appropriate server component portion, the parameter being created at the client computer; and

a module for loading and executing, on the server computer an applicable additional appropriate server component portion of the plurality of server component portions of the server application component for each an additional request received from the client component for an application function not available from any running server component portion, the additional request including a parameter associated with the additional appropriate server component portion, the parameter in the additional request being created at the client computer. or portions of the server application component; and

~~a module for running all executed portions until an end session command is received.~~

6. (Currently amended) The system according to claim 5, wherein one portion of the plurality of server component portions is a compact portion initially loaded and executed on the server computer upon receipt of a first application function request from the client component, the compact portion delivering a subset of functions applicable to commands most commonly requested to provide a fast executing initial portion of the application.

7. (Currently amended) A storage medium readable by a computer, the medium encoding a computer process to provide a method for incrementally executing a client/server application, leveraging existing communications network infrastructure having at least one client computer and at least one server computer, wherein the at least one client computer and the at least one server computer are in communication with each other over one or more communications links within the network infrastructure, the computer process comprising:

a processing portion for providing a server application component comprising a plurality of server component portions on the at least one server computer;

a processing portion for providing a client component on the at least one client computer, the server application component and the client component forming a client/server application;

a processing portion for loading and executing, on the server computer, an appropriate server component portion from the plurality of server component portions of the server

~~application component~~ applicable to and upon an initial request from the client component for an application function, the initial request including a parameter associated with the appropriate server component portion, the parameter being created at the client computer; and
a processing portion for loading and executing, on the server computer, an applicable additional appropriate server component portion of the plurality of server component portions ~~of the server application component for each~~ an additional request received from the client component for an application function not available from any running server component portion, the additional request including a parameter associated with the additional appropriate server component portion, the parameter in the additional request being created at the client computer. ~~or portions of the server application component; and~~
~~a processing portion for running all executed portions until an end session command is received.~~

8. (Currently amended) The storage medium according to claim 7, wherein one portion of the plurality of server component portions is a compact portion ~~initially~~ loaded and executed on the server computer upon receipt of a first application function request from the client component, the compact portion delivering a subset of functions applicable to commands most commonly requested to provide a fast executing initial portion of the application.

9. (Cancelled)

10. (New) The method according to claim 3 wherein the step of loading the subsequent server component portion is omitted if the subsequent function associated with the subsequent running portion is available from any running server component portion of the server component.

11. (New) The method according to claim 3 further comprising the step of:
creating the parameter at a client application.

12. (New) The method according to claim 3 further comprising the steps of:
at the client computer, accepting from a user, an indication of an end session;
at the client computer, generating, in dependence upon the indication of an end

session, an end session message;
at the server computer, receiving the end session message; and
at the server computer, terminating the execution and unloading from the memory, in dependence upon the end session message, of the server component portions.

13. (New) The system according to claim 1 wherein the loading of the subsequent server component portion is omitted if the subsequent function associated with the subsequent server component portion is available from any running server component portion of the server component.

14. (New) The system according to claim 1, wherein each client computer includes means for creating the initial parameter and the subsequent parameter at a client application.

15. (New) The system according to claim 1, wherein the client computer includes:
means for accepting from a user, an indication of an end session; and
means for generating, in dependence upon the indication of an end session, an end session message,
and wherein the server computer includes:
means for receiving the end session message; and
means for terminating the execution and unloading from the memory, in dependence upon the end session message, of the server component portions.

16. (New) A method of executing an application in an environment comprising a server and one or more than one client, the server comprising a server processor and a memory for executing a server component, the server component including an initial server component portion and one or more subsequent server component portions, the client comprising a client component, the server component and the client component forming the application, the method comprising the steps of:

- a) at the server computer, receiving an initial message from the client, the initial message including an initial parameter associated with the initial server component portion, the initial parameter being created by a client application;
- b) at the server, loading into the memory of the server, in dependence upon the initial parameter, the initial server component portion;
- c) at the server, executing the initial server component portion in the memory to

provide an initial function to the client;

- d) at the server, receiving a subsequent message from the client, the subsequent message including a subsequent parameter associated with the subsequent server component portion, the subsequent parameter being created by the client application;
- e) at the server, loading into the memory of the server, in dependence upon the subsequent parameter, the subsequent server component portion; and
- f) at the server, executing the subsequent server component portion in the memory to provide a subsequent function to the client.

17. (New) The method according to claim 16 wherein the step of loading the subsequent server component portion is omitted if the subsequent function associated with the subsequent server component portion is available from any running server component portion of the server component.

18. (New) The method according to claim 16 further comprising the step of:
creating the initial parameter and the subsequent parameter at a client application.

19. (New) The method according to claim 16 further comprising the steps of:
at the client, accepting from a user, an indication of an end session;
at the client, generating, in dependence upon the indication of an end session, an end session message;
at the server, receiving the end session message; and
at the server, terminating the execution and unloading from the memory, in dependence upon the end session message, of the server component portions.

20. (New) A system for executing an application in an environment comprising:
a server for one or more than one client, the server including a memory for executing a server component, the server component including an initial server component portion and one or more subsequent server component portions, the client comprising a client component, the server component and the client component forming the application, the server further including:
means for receiving an initial message from the client, the initial message including an initial parameter associated with the initial server component portion, the initial parameter being created by a client application;

means for loading into the memory of the server, in dependence upon the initial parameter;

means for executing the initial server component in the memory to provide an initial function to the client;

means for receiving a subsequent message from the client, the subsequent message including a subsequent parameter associated with the subsequent server component portion, the subsequent parameter being created by the client application;

means for loading into the memory of the server, in dependence upon the subsequent parameter, the subsequent server component portion; and

means for executing the subsequent server component in the memory to provide a subsequent function to the client.

21. (New) The system according to claim 20, wherein the loading of the subsequent server component portion is omitted if the subsequent function associated with the subsequent server component portion is available from any running server component portion of the server component.

22. (New) The system according to claim 20, wherein the client includes means for creating the initial parameter and the subsequent parameter at a client application.

23. (New) The system according to claim 20, wherein the client includes means for accepting from a user, an indication of an end session, and means for generating, in dependence upon the indication of an end session, an end session message, and wherein the server includes means for receiving the end session message, and means for terminating the execution and unloading from the memory, in dependence upon the end session message, of the server component portions.
